Topic Description...

Mastitis is a very complex subject to understand, and it is the most expensive disease in the dairy industry today. It occurs when an udder becomes infected by bacteria, which results in high somatic cell counts, reduction in milk production and undesirable milk quality.

Descripción del tema...

La mastitis es un tema muy complejo de entender y es una de las enfermedades más costosas en la industria lechera. La mastitis sucede cuando la ubre es infectada por bacteria lo cual resulta en conteos elevados de Célula Somática, baja producción y leche de indeseable calidad.
