

2022 North Country 1st Cutting Alfalfa-Grass Progress Report

May 18, 2022 Report

Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Fields on the graph with 0" alfalfa height have been mowed.

The *North Country 1st Cutting Alfalfa-Grass Progress Report* is a Cornell Cooperative Extension project. Data collection by L Ferlito, M Hunter, A Jantzi, M Spence, J Lawrence, A Wilder, J Tucker, K Sample, E Bever, J Krauss, and K O'Neil.

Goal % NDF - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to 1.2/day for grass. Expect the lower end of that range in cooler weather and the higher end in warm.

Weekly Tips and Observations

- The grassiest fields are at, or approaching, peak quality this week. Check your own 70%+ grass fields for grasses heading or approaching boot stage.
- This past week has been mostly about rain. Portions of the North Country have received over 2.3" of precip in the past 3 days while others saw less than 0.5". Several days will be needed for drainage and drying for many areas before field work may continue.
- GDD_{41} have largely caught up with our the 15-year average across the NNY region. Alfalfa and grasses have reflected this by jumping over 7" this week, from 9" to 16.2" on average.
- Some have reported grasses beginning head, but most grasses remain pre-boot. Check your own fields by feeling the stems to locate flower heads inside.
- Nitrogen should have already been applied to grass fields (if less than 50% legume and no manure history).

2022 North Country 1st Cutting Alfalfa-Grass Progress Report

County	Town/Field	Elevation (feet)	Soil		Alfalfa Height, inches							
			Type	% Grass	2-May	9-May	16-May	23-May	31-May	6-Jun	13-Jun
