

2023 North Country 1st Cutting Alfalfa-Grass Progress Report

Week of May 15, 2023

Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Fields on the graph with 0" alfalfa height have been mowed.

The *North Country 1st Cutting Alfalfa-Grass Progress Report* is a Cornell Cooperative Extension project. Data collection by L Ferlito, M Hunter, A Jantzi, M Spence, J Lawrence, K. Gugin, M. Jordan, A Wilder, J Tucker, K Sample, E Bever, J Krauss, and K O'Neil.

Goal % NDF - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to 1.2/day for grass. Expect the lower end of that range in cooler weather and the higher end in warm.

Weekly Tips and Observations

- Alfalfa and grass continue to develop, slow and steady. Our cool and rainy weather this past week produced just 3.5" of alfalfa height and a few buds. Average alfalfa height was 20.6" and ranged from 15" to 28". Farms are beginning to harvest 1st cutting this week, so many fields may be mowed by next week.
- Keep a close eye on your grass fields and pastures. Grasses continue to mature and grow slowly, but is variable across the region. Some improved grasses have headed while others are reaching late boot stage.
- GDD₄₁ since April 1 continue to be 20 to 70 GDD ahead of the 15-year average across NNY except for the Clayton-Chaumont area which is now slightly behind. Insufficient soil moisture is combining with our cold temperatures to produce slow grass growth.
- It's now too late for an N application to help 1st cutting, so save it for 2nd cutting. Nitrogen is NEVER recommended for any field with 25% legume or more as this will favor the grass at the expense of legume in the stand, so there is no economical advantage.

2023 North Country 1st Cutting Alfalfa-Grass Progress Report

County	Town/Field	Elevation (feet)	Soil		Alfalfa Height, inches							
			Type	% Grass	1-May	8-May	15-May	22-May	30-May	5-Jun	12-Jun
