

1st Cutting Forage Quality Update

Alfalfa fields increased height dramatically in the past five days. Fields were 4-7 inches taller today but that should probably not be unexpected. Unlike corn and soybeans that have a Growing Degree Day (GDD) base of 50F which means we only count temperatures above 50F, alfalfa has a GDD base of 41F. Last week was warm enough to move the alfalfa along and with a little warmer rain at the end of the week it grew quickly.

Although we seem to be back to the saturated soils again today after seeing dust fly last week we can only encourage that when the soil dries out you look at your 1st cutting forages and make an assessment. Most grass fields should be cut at this time and many mixed stand should also be cut. The current weather conditions are making for difficult management decisions but consider stop trying to plant corn and work on dairy quality first cutting when weather allows. If there is still quality there to be harvested it may be best to take it. Although the corn planting window is getting smaller it is still there. However it cannot be stressed enough that each farm and field is different so know your conditions.

Here are three numbers that are helpful using alfalfa height as an indicator of NDF content:

Begin cutting 100% grass stands when nearby alfalfa is **14** inches tall for the desired 50% NDF.

Begin cutting 50/50 mixed alfalfa and grass stands when nearby alfalfa is **22** inches tall for the desired 44% NDF.

Begin cutting 100% alfalfa stands when alfalfa is **28** inches tall for the desired 40% NDF.

The desired NDF for all grass fields is 50%, 50/50 mixed alfalfa and grass fields is 44%, and pure alfalfa stands is 40%. Predicted days to cut are based on daily NDF increases for grasses of 1% point, 50/50 mixed stands of .8% points and alfalfa of .5% point. Typically NDF increases about 0.8 to 1.2/day for grasses expecting the lower end of that range in cooler weather and the higher end in warm. Alfalfa NDF increases about 0.4 to 0.7/day again figuring the lower end of that range with cool temperatures and the higher in warm.

Summary of Alfalfa Height and Prediction of % NDF - May 16, 2011

County	Town	Road Name	Elevation	Alfalfa Height Inches	Predicted Grass % NDF	Predicted 50/50 Mix % NDF	Predicted Alfalfa % NDF	Predicted Date to Cut Grass	Predicted Date to Cut Mix	Predicted Date to Cut Alfalfa
