

2017 North Country 1st Cutting Alfalfa Quality Monitor

May 23, 2017 REPORT

Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Points on the graph with 0" alfalfa height have been mowed.

The North Country 1st Cutting Forage Quality Monitoring Program is made possible by Cornell Cooperative Extension. Data collection by Ron Kuck, Alyssa Couse, Melissa Spence, Joe Lawrence, Harry Fefee, Sara Bull, Eric Bever, Bill Bullock and Kitty O'Neil.

Goal % NDF - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to 1.2/day for grass. Expect the lower end of that range in cooler weather and the higher end in warm.

Weekly Tips and Observations

- Alfalfa and grass continue to grow slowly, though warming temps should speed growth. On average, alfalfa heights are still ahead of this week in 2016 (20.7" vs 19.9" in 2016). Many of the grasses were headed this week. About half of the fields with 50% grass or more were at or beyond ideal NDF according to the graph above (above the line). They should be mowed ASAP for best quality. Again, once fields are past their prime send them to the bottom of the mowing order and prioritize fields where quality is still high. Go back to the declining fields later, as time permits.

- With this wet weather delay, skip new hay seedings this spring to move directly on to corn planting. Hay fields can still be seeded in late summer, but corn has to be planted ASAP.

- Monitor grass fields and winter cereals closely as we are at or near optimal cutting time - they could be ready now or may head quickly with the warmer, drier weather. Be sure to mow at a height of no less than 4" above soil surface and below grass heads.

2017 North Country 1st Cutting Alfalfa Quality Monitor

County	Town/Field	Elevation (feet)	Soil Type	% Grass	Grass Species	Alfalfa Height, inches
