

North Country 1st Cutting Alfalfa-Grass Quality Monitor

May 29, 2018 REPORT

Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Points on the graph with 0" alfalfa height have been mowed.

The North Country 1st Cutting Forage Quality Monitoring Program is made possible by Cornell Cooperative Extension. Data collection by Ron Kuck, Alyssa Couse, Melissa Spence, Joe Lawrence, Jessica Prosper, Sara Bull, Eric Bever, Bill Bullock and Kitty O'Neil.

Goal % NDF - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to

Weekly Tips and Observations

- Alfalfa gained over 8" this week, really taking advantage of the warm temperatures. Grasses are now mostly flowered, though some reed canarygrass is still in late boot stage. Earlier heading grasses are flowered in most fields. 30 to 100% Grass fields are now at or above target NDF and are declining in quality. Check each of your alfalfa and grass fields to assess maturity - it will vary slightly from field to field and from grass species to species.
- Mixed stands with 10-30% grass and most pure alfalfa stands will be at peak quality within a week.
- It is good to see how many fields were mowed and chopped this week. Good first cutting progress was enjoyed by many farms as rain has not materialized even when forecast across much of NNY. Yields and quality are expected to be good.
- Outside of a few alfalfa snout beetle observations, very few pests have been reported in alfalfa and grass fields.
- It's too late to fertilize grass hay fields with N for first cutting. Fertilize with N for 2nd cutting immediately after 1st cutting. Once grasses have reached later phases of vegetative growth, they will not respond to N well and the investment in fertility will not yield a good return.

North Country 1st Cutting Alfalfa-Grass Quality Monitor

County	Town/Field	Elevation (feet)	Soil Type	% Grass	Grass Species	Alfalfa Height, inches				
						7-May	14-May	21-May	28-May	4-Jun
St. Lawrence	Depeyster	320	Adjidaumo	13	Reed Canarygrass	5.5	9	15	- cut -
