

North Country 1st Cutting Alfalfa-Grass Quality Monitor

May 14, 2019 REPORT

Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Points on the graph with 0" alfalfa height have been mowed.

The *North Country 1st Cutting Forage Quality Monitoring Program* is made possible by Cornell Cooperative Extension. Data collection by Alyssa Couse, Jake Ledoux, Joe Lawrence, Jessica Prosper, Sara Bull, Jonathan Krauss, Bill Bullock and Kitty O'Neil.

Goal % NDF - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to 1.2/day for grass. Expect the lower end of that range in cooler weather and the higher end in warm.

Weekly Tips and Observations

- Alfalfa growth continues to be slow due to cool, wet spring weather. Alfalfa grew about 3" on average since last week. Grasses all remain vegetative.
- Many fields all across the region have sustained serious winter damage and are complete losses. Both alfalfa and grass have been killed in many fields. Damage appears to be mostly a result of ice sheeting from a series of thaw/freeze cycles in late winter, however some fields were damaged by loss of snow cover. Consider complete reseeding if loss within a field is 30% or greater. It is usually more cost effective to reseed completely than to patch up dead areas when losses are that significant. See [this factsheet](#) for guidance on reseeding decisions.
- Alfalfa snout beetle adults are beginning to emerge and walk. They do not fly. Report any ASB observations to your local CCE office so we can monitor infested areas.
- Nitrogen should have been applied to grass fields (if less than 50% legume and no manure history) by now.

North Country 1st Cutting Alfalfa-Grass Quality Monitor

County	Town/Field	Elevation (feet)	Soil Type	% Grass	Grass Species	Alfalfa Height, inches						
						7-May	14-May	21-May	28-May	4-Jun	11-Jun	18-Jun
