

2020 North Country 1st Cutting Alfalfa-Grass Quality Monitor

May 26, 2020 Report

Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Points on the graph with 0" alfalfa height have been mowed.

The North Country 1st Cutting Forage Quality Monitoring Program is made possible by Cornell Cooperative Extension. Data collection by Lindsay Ferlito, Mike Hunter, Mellissa Spence, Joe Lawrence, Jessica Prosper, Eric Bever, Jonathan Krauss, Csey Havekes and Kitty O'Neil.

Goal % NDF - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to 1.2/day for grass. Expect the lower end of that range in cooler weather and the higher end in warm.

Weekly Tips and Observations

- Alfalfa growth jumped ahead 8" with warmer temperatures this past week, but is still well behind 2018 and 2019 averages. Alfalfa averaged 18" across NNY this week, compared with about 27" in 2018 and 21" in 2019. According to the graph above, fields with 60-70% grass or more are at peak quality early this week and are now on the decline.
- Many of the earlier-heading grasses are headed now and are declining in quality. A few of the later-heading grasses are close to heading.
- It's too late to apply N to grass fields (if less than 50% legume and no manure history). At this point, urea or manure should go on after first cutting.
- Watch grass fields closely for signs of maturity and developing quality. Our lack of GDD has not slowed their maturity but rather has reduced stem and leaf growth and yield. Grass quality at late boot is likely to be better than a normal year at late boot because of the slow accumulation of GDD this spring.

2020 North Country 1st Cutting Alfalfa-Grass Quality Monitor

County	Town/Field	Elevation (feet)	Soil		Alfalfa Height, inches						
			Type	% Grass	4-May	11-May	18-May	26-May	1-Jun	8-Jun	15-Jun
